

Private Loans: Facts and Trends

August 2009

THE PROJECT ON
STUDENT DEBT

Private student loans are one of the riskiest ways to finance a college education. Like credit cards, they usually have variable interest rates that are higher for those who can least afford them – as high as 18% in 2008. But unlike credit card debt, these loans are nearly impossible to discharge in bankruptcy. And private student loan borrowers are not eligible for the important deferment, income-based repayment, or loan forgiveness options that come with federal student loans.

Experts agree that students and families should exhaust all of their federal aid options before even considering private loans. Nevertheless, more college students have been turning to private loans before taking out all they can in safer and more affordable federal loans, or before taking out any federal loans at all.

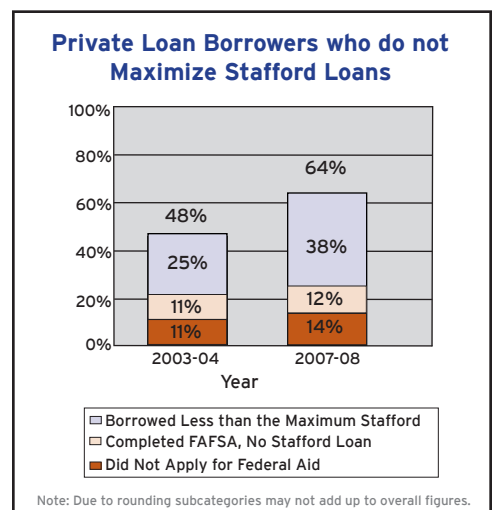

The following facts and figures reflect borrowing levels before the credit crunch, which hit the private student loan industry hard in the spring of 2008. Although private loans are now more likely to require a co-signer and a higher credit score than in recent years, these loans are still available from Sallie Mae, Citibank, and other major lenders.

Big increase in private loan borrowing by undergraduates

- **The percentage of all undergraduates with private loans** has risen dramatically, from 5% in 2003-04 to 14% in 2007-08, and the number of private loan borrowers increased from approximately 935,000 to 2,946,000.
- **Private loan volume** also grew substantially, from \$7.2 billion in 2003-04 to \$15.0 billion in 2007-08.*
- **Private loan borrowing by sector**
 - *For-profit* (proprietary) colleges had the largest proportion of students taking out private loans, and the largest increase in private loan borrowing: 42% of all proprietary school students had private loans in 2007-08, up from 12% in 2003-04.
 - At *private non-profit four-year* schools, 25% of students had private loans in 2007-08, up from 11% in 2003-04.
 - At *public four-year* schools, 14% of students had private loans in 2007-08, up from 5% in 2003-04.
 - At *public two-year* schools, 4% of students had private loans in 2007-08, up from 1% in 2003-04.

Students could be using cheaper, safer federal loans

- Almost two-thirds (64%) of private loan borrowers in 2007-08 **borrowed less than they could have in Stafford loans**, compared to less than half (48%) of private loan borrowers in 2003-04.
- In 2007-08, 26% of private loan borrowers **took out no Stafford loans at all**: 14% did not apply for federal financial aid, and 12% filled out the FAFSA (a requirement for federal loans) but did not take out a Stafford loan. In 2003-04, 22% of private loan borrowers took out no Stafford loans.
- In 2007-08, 38% of private loan borrowers had Stafford loans, but **borrowed less than the maximum amount**, up from 25% in 2003-04.

The majority of private loan borrowers attend lower priced schools

- In 2007-08, 63% of private loan borrowers attended schools charging \$10,000 or less in tuition and fees. More than half of these borrowers (34% of all private loan borrowers) attended schools with tuition and fees of \$5,000 or less.
- Although a minority (37%) of private loan borrowers attend higher priced schools, students at these schools are more likely to borrow. In 2007-08, 32% of students at schools charging more than \$10,000 in tuition and fees took out private loans, compared to 11% of students at lower cost colleges.
- Only 16% of all undergraduates attended schools with tuition and fees of \$10,000 more than in 2007-08.

Private loan borrowers disproportionately attend private colleges

- In 2007-08, for-profit schools and private nonprofit four-year schools had disproportionate shares of students with private loans.
 - Students attending *for-profit* schools composed about 9% of all undergraduates, but 27% of those with private loans.
 - Students attending *private nonprofit four-year* schools composed about 13% of all undergraduates, but 22% of those with private loans.
 - The percentage of all undergraduates who attend *public four-year* schools (29%) was about the same as the percentage of private loan borrowers who attend these schools (28%).
 - Students attending *public two-year* schools are least likely to take out private loans: they composed about 40% of all undergraduates but only 12% of private loan borrowers.

African-American undergraduates are now the most likely to take out private loans

- The percentage of African-American undergraduates who took out private loans quadrupled between 2003-04 and 2007-08, from 4% to 17%.
- Private loan borrowers of all races and ethnicities were about as likely to turn to private loans before taking out all they could in federal loans in 2007-08.

About the Data: Unless otherwise noted, the figures in this fact sheet are based on the Project on Student Debt’s analysis of data from the U.S. Department of Education’s National Postsecondary Student Aid Study (NPSAS), a comprehensive nationwide survey conducted every four years. These figures represent borrowing that took place in a single academic year, not over the entire time a student was in school. Calculations only include students who are citizens or permanent U.S. residents who attend colleges in the fifty states, District of Columbia, or Puerto Rico. A very small percentage of these students may be ineligible for federal loans for various reasons. The term “private loans” only includes bank and lender-originated loans, not all non-federal loans.
